Like water, safety requires a national approach

Despite improvements in construction over the past 20 years, the industry's fatality rate remains unacceptably high.

Construction site labour makes up eight percent of the Australian workforce but accounts for more than 15% of all fatalities in the workplace. On average one person is killed on a construction site each week in Australia. Thousands more are seriously injured.

According to figures released by the Australian Safety and Compensation Council for 2003-2004, the fatality rate in the construction sector equates to a 6.7 fatality rate per 100,000. The figure is probably even higher when you take into account diseaserelated deaths. The construction fatality rate is an estimated five times higher than the mining industry.

Clearly there is a need to articulate a shared vision across industry and government to guide effective principles and practices that will improve safety.... More details
